

**IN THE SPECIFICATION:**

*In the paragraph on page 11, lines 22-30:*

Furthermore, in order to ensure that heat generated by the operation of the flow sensing thermistor 35 does not substantially impact upon the temperature sensing thermistor 34, it can be seen in Figure 4 that upon alignment of locating tooth means 46 and locating depression 47, the temperature and flow sensing thermistors 34, 35 are displaced across the gases flow (that is, they are not aligned in the direction of flow) so that they are each substantially unaffected by the others presence. Also, the heat producing flow sensing thermistor 35 is positioned ~~upstream~~ downstream of the temperature sensing thermistor 34 so that the generated heat is carried away from the temperature ~~sensor~~ sensing thermistor 34 by the gases flow.
